

Dropbox + AirWatch

Simple for users, secure for enterprise

Enable business mobility and secure collaboration on the go

The next decade of business mobility will be driven by solutions that are both simple for users and secure for enterprise. Using AppConfig capabilities, Dropbox and AirWatch are working together to provide instant mobile productivity with a seamless out-of-the box experience, enabling enterprise-ready apps with minimal setup required. Companies can now collaborate securely using Dropbox and AirWatch Enterprise Mobility Management (EMM).

Empower employees. Help your employees be more productive by letting them use Dropbox, a tool they already love.

Simplify adoption. Remove the hurdle of complicated configurations with auto-configured apps.

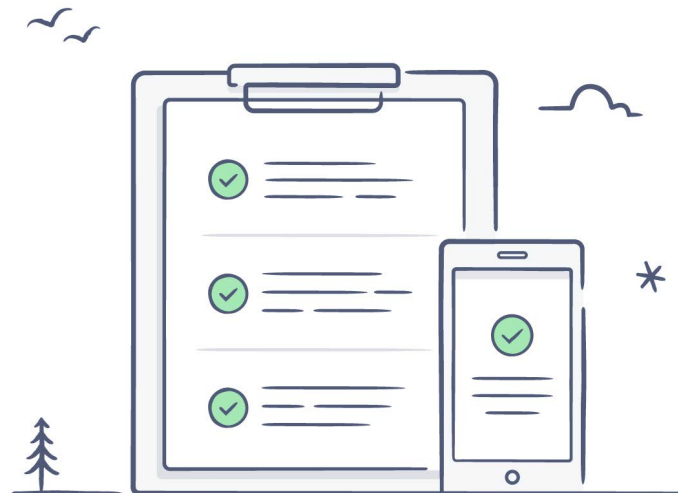

Save time and money. Not only can you reduce IT helpdesk calls and cut printing costs, but you can leverage your existing investments in EMM, VPN, and identity solutions.

Use one-touch login. Eliminate the need for containers or SDKs with vIDM “one-tap access” to a Dropbox account.

Keep data secure. Take advantage of AirWatch integrated security features like app tunneling, encryption, data loss prevention, and other device restrictions to secure your corporate data.

“Companies of all sizes are taking advantage of Dropbox to increase productivity and get work done with the devices and apps they already use. Participating in the AppConfig Community is one of the ways we’re helping our customers enhance mobile security without sacrificing the simplicity and ease of use that’s core to the Dropbox experience.”

Patrick Heim, Head of Trust & Security at Dropbox
